Unit 3: CSS Site Styling

1. **What I've done for unit 3?**

   I have learned the relevant knowledge of css through war3school.com and overflower.com, completed some tutorials on css. I realized the function of the product catalog through css. When the customer's mouse moves over the product category, the product catalog of this category will automatically pop up.

   I created css files for 3 pages home.html, phone.html, serviceCenter.html, Home.html provides the main product catalog, phone.html only sells mobile phones, and serviceCenter.html provides after-sales service. It can be more convenient through css of planning my site..

2. **What went well and what did not go well?**

   Mostly, the styling of the website went as expected, for a commercial website, content planning is also very important. I don't have enough planning for what services a commercial website should provide.

3. **the rationale for what I have done.**

   The principle of my website design is simple and stylish. Customers only need the least operation to browse the most products, so I designed a pop-up product catalog, and only need the customer to move the mouse ,and can display enough products. Instead of clicking. The whole website also uses simple color matching as much as possible to make the whole website look very clean.

4. **What I'd do differently if I had to do it again**

   I will plan better, and consider more compatibility on PC and mobile devices..

5. **why your changes are improvements by relating them to the personas and scenarios identified in Unit 1?**

   My homepage succinctly lists the product names that customers need. When the customer's mouse moves over these catalogs, the corresponding product catalog will automatically pop up, which is convenient for customers to choose according to their needs. Reduce text description and increase interaction .
